

Welcome to:

Ecology of Disease

Prof Peter O'Donoghue

1

Description

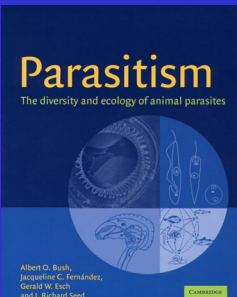

- Study of ecological interactions between disease-causing organisms, their hosts & the external environment; to explain disease occurrence, distribution & transmission.
- Impact of vector biology, drug resistance, water/food treatment, reservoir hosts on disease incidence.
- Mathematical prediction models

PATHOGENS

Micro-organisms

- Viruses
- Bacteria
- Protozoa
- Helminths
- Arthropods

4

HOSTS

Animals

- Mammals
- Reptiles
- Birds
- Fish
- Arthropods

Plants

- Cultivars

5

DISEASES

Infectious

- Enteric
- Blood
- Tissues
- Organs
- External

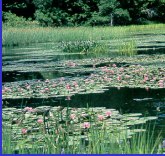

6

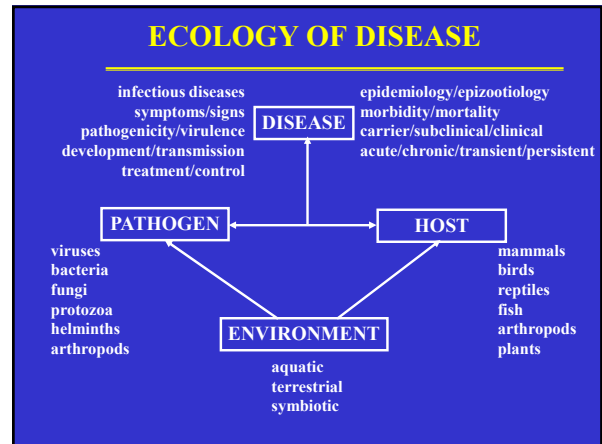

ENVIRONMENTS

- Aquatic
- Terrestrial

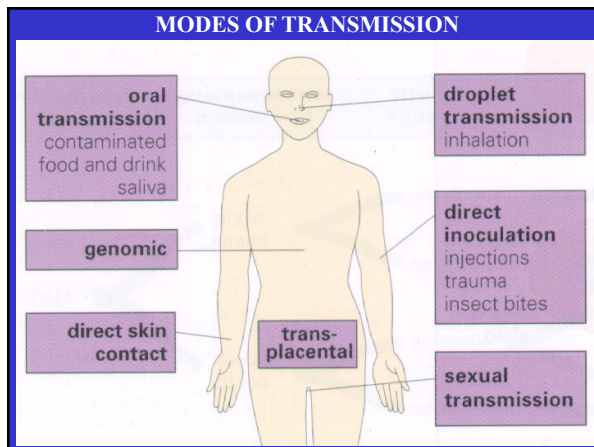

- moisture
- temperature
- oxygen

7

8

9

Learning Objectives

You will learn to:

- differentiate endemic and emergent diseases;
- recognize patterns of infection;
- understand transmission factors;
- investigate water-borne outbreaks of disease;
- assess hazards inherent to food production;
- understand the role of paratenic and reservoir hosts;
- analyse the impact of climate on organism survival;
- apply mathematical principles to disease prediction (modelling greenhouse effects, deforestation, urbanization).

10

Epidemiology?

Like ecologists, epidemiologists seek to understand:

- species **richness** (biodiversity)
- species **abundance** (populations/communities)
- species **distribution** (temporal, spatial)

Study human pathogens = epidemiology
Study animal pathogens = epizootiology

11

Epidemiological studies

<p>Four main types:</p> <ul style="list-style-type: none"> • Case series (descriptive) <ul style="list-style-type: none"> – index, incidental, miscellaneous • Case control studies (retrospective) <ul style="list-style-type: none"> – cases + controls interviewed • Cohort studies (prospective) <ul style="list-style-type: none"> – cohort followed forward in time • Outbreak studies (predictive) <ul style="list-style-type: none"> – rate of change in population 	<p><u>Maths</u></p> <p>not quantitative</p> <p>statistics Odds Ratio</p> <p>statistics Relative Risk</p> <p>calculus Differential Equations</p>
---	---

12

OR and RR

	CASES	CONTROLS
EXPOSED	A	B
UNEXPOSED	C	D

Odds Ratio (OR) = $\frac{AD}{BC}$

Relative Risk (RR) = $\frac{A / (A+B)}{C / (C+D)}$

>> 1 causative?
 ~ 1 no association
 << 1 protective?

13

OUTBREAKS

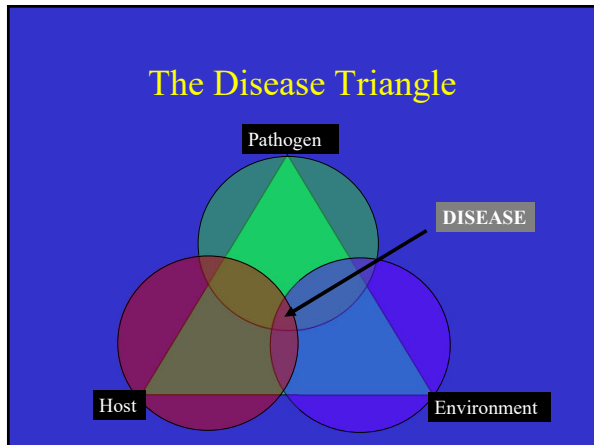

Pathogens must reproduce themselves to survive
(reproduction rate = R)

R>1 epidemic
 R=1 perpetuation
 R<1 extinction

time

Basic (case) reproduction rate (R₀)
 = average number of secondary infections
 resulting from primary case in **susceptible** population
