

## BioMedical Parasitology

---

### Introduction

'armed' scolex of tapeworm
hydatid cyst in human liver

1

## Learning Objectives

---

You will learn to:

- differentiate major parasite assemblages;
- assess conventional and modern diagnostic methodologies;
- recognize patterns of parasitic infections and diseases;
- value fundamental knowledge of parasite life-cycle strategies;
- identify factors involved in the resurgence of parasitic diseases;
- understand molecular mechanisms of drug-resistance; and
- appreciate molecular biological approaches to parasite control.

4

## Course description

---

- Study the complex interactions between parasites, their hosts & their environments; to explain disease incidence, distribution, morbidity and mortality.
- Development of molecular, cellular, organismal and population biology interventions for treatment and control.

2

3

## Three modes of existence on earth!

- aquatic (many species)
- terrestrial (some species)
- parasitic (overwhelming majority)

PARASITES RULE!

6

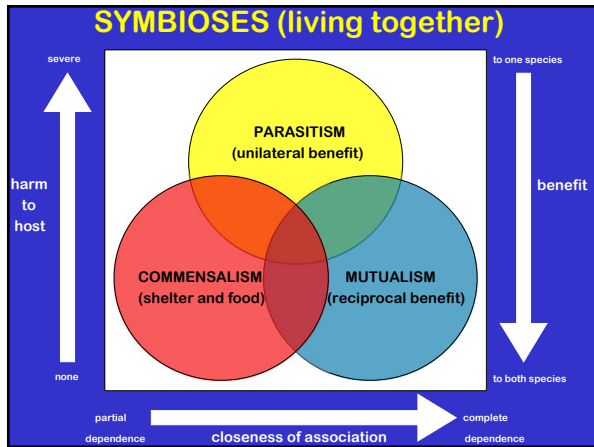

## PARASITISM?

Type of relationship	Organism 1 (usually larger)	Organism 2 (usually smaller)	Example
<b>SYMBIOSIS</b> ("living together") (direct contact between organisms) (usually long term)			
- mutualism	host benefits	symbiont benefits	ruminants/ciliates
- cleaning symbiosis	host benefits	cleaner benefits	fish/cleaner wrasse
- commensalism	host unaffected	commensal benefits	reptiles/trichomonads
- phoresis	host unaffected	phoront benefits	mollusc/anemone
- inquilinism	host unaffected	inquiline benefits	worm tubes/bacteria
- neutralism	host unaffected	symbiont unaffected	difficult to prove
- parasitism	host harmed	parasite benefits	humans/nematodes
- parasitoidism	host harmed	parasitoid benefits	caterpillar/wasp larva
- amensalism	unaffected	harmed	mould/bacteria

7

10

8

11

### ORGANISMS

Size	Organism	Category
10 <sup>0</sup> m	Tapeworm	worms
10 <sup>-1</sup> m	Intestinal nematode	worms
10 <sup>-2</sup> m	Adult schistosome	worms
10 <sup>-2</sup> m	Adult Trichinella	worms
10 <sup>-2</sup> m	Larval worm	worms
10 <sup>-3</sup> m	Amoeba	protozoa
10 <sup>-3</sup> m	Trypanosome	protozoa
10 <sup>-3</sup> m	Plasmodium	protozoa
10 <sup>-4</sup> m	Staphylococcus	bacteria
10 <sup>-5</sup> m	Pox virus	viruses
10 <sup>-5</sup> m	Influenza virus	viruses
10 <sup>-6</sup> m	Polio virus	viruses

**pathogens** → **hosts**

arthropods → humans  
helminths → animals  
protozoa  
fungi  
bacteria  
viruses

If men are from Mars and women are from Venus, where are parasites from?

9

### PARASITES

**Pathogenic**

- Protozoa
- Helminths
- Arthropods

12

## HOSTS

---

- **Humans**
  - medical health
- **Animals**
  - veterinary health
  - plus zoonoses
- **Vectors**
  - transmission

13

## Disease amelioration

---

Despite sensationalism of media & lecturers, parasitic diseases are limited in incidence due to:

Parasite Factors

- distribution/abundance
- host range/specificity
- pathogenicity/virulence

Host Factors

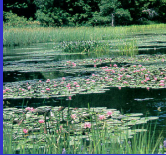

- resistance/susceptibility - innate
- protective immunity - acquired

16

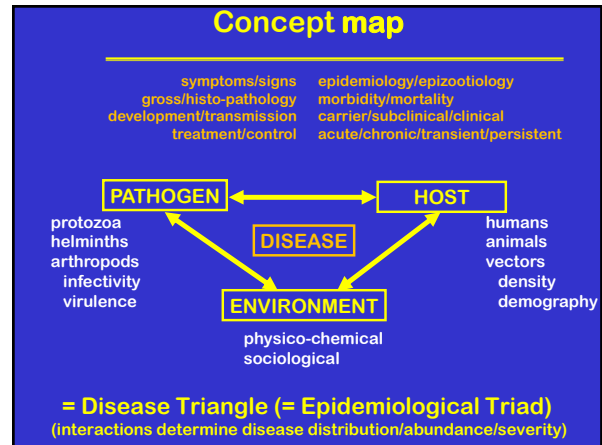

## ENVIRONMENTS

---

- **Physico-chemical**
  - moisture
  - temperature
  - oxygen
- **Sociological**
  - developed countries
  - developing countries
  - human behaviours

14

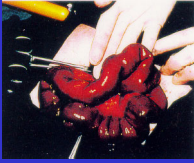

17

## DISEASES

---

**Infectious**

- Enteric
- Blood
- Tissues
- Organs
- External

15

## Impact of Disease

---

**Consequences**

- mortality (death)
- morbidity (sickness)
- production losses (body weight)
- lesions (quality)

**Scope**

- individuals (personal medicine)
- cohabitants (family counselling)
- neighbours (community medicine)
- populations (WHO, CDC, etc)

18

## Parasite overdispersion

Simple truth - most infections remain asymptomatic

Many hosts have some parasites → no disease  
Some hosts have many parasites → disease

19

## Immunity

Previous exposure confers immunity:

- sterile immunity (parasites eradicated)
- premunity (concomitant) (some parasites persist)

22

## Disease is merely the tip of the iceberg

20

## Infections confined to susceptible hosts

- age (young/old)
- gender (pregnant/lactating females)
- physiological state (malnourished, stressed...)
- immuno-competency
  - congenital immunodeficiencies (genetic deficits)
  - acquired immunodeficiencies (infection)
  - immunosuppression (chemotherapy/transplants)

neonates especially vulnerable

23

## Clinical threshold

Disease related to severity of infection:

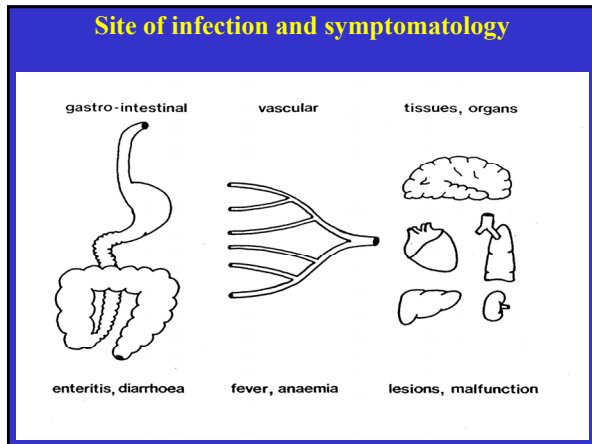

- latent infections (incubation period)
- chronic infections (concomitant/premunity)
- subclinical infections (asymptomatic)

21

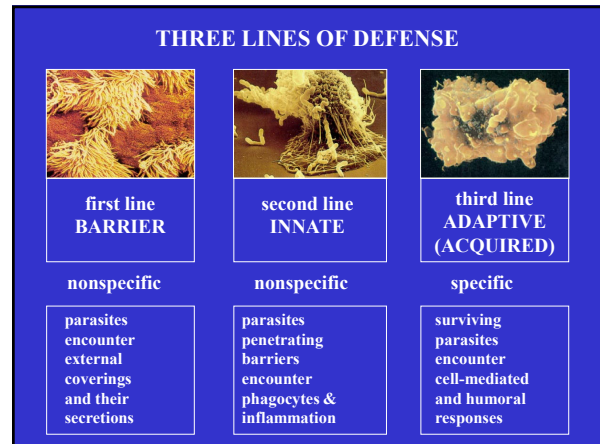

## WHO top 10 parasites

Disease	Infections/yr	Deaths/yr
1. Ascariasis	900 million	20,000
2. Hookworm disease	800 million	55,000
3. Malaria	800 million	1,500,000
4. Trichuriasis	500 million	-
5. Amoebiasis	480 million	75,000
6. Filariasis	280 million	-
7. Schistosomiasis	200 million	750,000
8. Giardiasis	200 million	-
9. Trypanosomiasis	25 million	65,000
10. Leishmaniasis	1 million	1,000

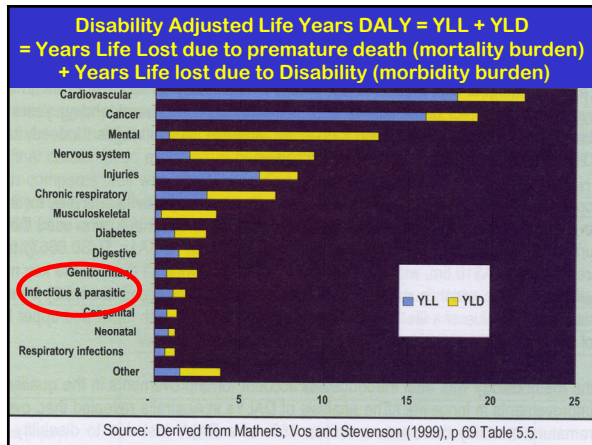

24

25

28

26

### Co-evolution

#### Host-parasite interactions

- parasites with a long co-evolutionary history are less pathogenic (some are even border-line commensals or mutualists)
- parasites are poorly adapted to humans (cf. zoonoses) and are more likely to cause serious disease

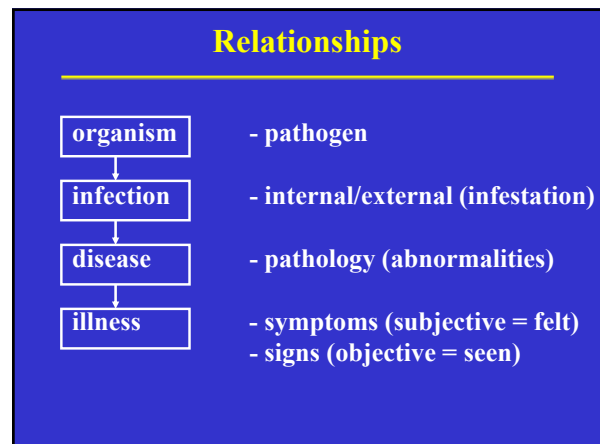

29

### How are hosts protected?

- natural resistance
  - genetically determined
  - inherited (basis of breeding programs)
- acquired immunity
  - humoral responses (extracellular parasites)
  - cell-mediated responses (intracellular parasites)

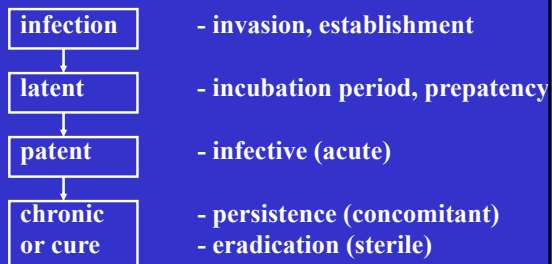

review three lines of defense

27

30

## Infection kinetics

31

## Impact of pathogens

### Viral pathogens

- cell death (lysis)
- metabolic disruption (persistent/latent)
- cell transformation (oncogenes/tumor)

### Bacterial pathogens

- motility/attachment
- endotoxins (LPS)
- inflammation

### Parasitic pathogens

- intracellular → cell destruction
- extracellular → tissue damage
- organ lesions/dysfunction
- immunopathology (hypersensitivity)

34

## Epidemiology

Study of disease distribution (temporal/spatial)

- prevalence (cross-sectional) single time point
- incidence (longitudinal) change over time
- intensity (parasite burden per host)

Diseases may be:

- established (endemic/enzootic)
- locally acquired (autochthonous)
- imported/introduced/exotic
- epidemic (outbreak)

32

## Virulence

Capacity to cause disease (morbidity/mortality)

- often measured as LD<sub>50</sub> or ID<sub>50</sub>

Virulence factors

- multiplication
- feeding
- cytotoxicity
- immuno-evasion
- tropism (tissue/cell)
- host specificity (ecological - sympatry)  
(ethological - behaviour)  
(physiological - molecular)

33
